

## A study of prolonged fasting Volume 203

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1915 Excerpt: ...Here there is a gradual rise for the right hand until next to the last day, while the curve for the left hand begins to drop where it should according to our analysis. In general, we may therefore say that fatigue appears in both hands early in the series. The curve for the left hand drops far below the record of the first few days. The curve for the right hand shows less drop, due to the greater influence of practice, so that the two curves tend to approach one another. fast began fast endetf Later tests Fio. 27.--Strength tests. TACTUAL-SPACE THRESHOLD. A pair of dividers with wooden tips were used as an sesthesiometer. The threshold was found on the volar side of the forearm, about 4 inches from the elbow. The points were applied on either side of a red-ink dot which was made on the arm on the first day and renewed when necessary. The method of minimal change, with ascending and descending series, was employed; 5 trials, excluding one-point vexier trials, were made at each distance; 4 correct out of 5 was considered the threshold.1 For the first few days the curve (XI, fig. 28) keeps the high level of 7 cm. On the seventh day there is a drop to 5.5 cm., then a slight rise to a level of 6 cm. and a high threshold of 6.5 cm. on the fourteenth day, followed by a fall to the minimum of 5 cm. on the twenty-second day, which minimum is again reached on the twenty-sixth and thirtieth It had been intended to call 3 out of 5 the correct threshold, but this was not found feasible. The threshold is probably too high, but for the present purpose, where the change and not the absolute threshold is being investigated, this does not matter. The curve shows no record for the fourth and fifth days. The experimenter was

absent on these days and the physician ...
